The present invention describes peptides (I) binding to galanin receptor proteins. (I) contain the sequence APAHRGRGG or one substantially lidentical to it, and their precursors, salts, amides and esters, which bind especially to rat galanin receptor proteins. Products from the present invention are used in assays of galanin/galanin receptor binding and the development of drugs acting on galanin/galanin receptor binding function improvers, appetite improvers, and function regulators for the womb, kidney, prostate, testis or skeletal muscle. AAY45129 to AAX45154 and AAX25518 to AAX2552 represent sequences used in the exemplification
                                                                                                                                                                                                                                                                                   of the present invention.

Preparation of a new physiologically active peptide having a cleaved cysteine residue as N-terminal $\,$ Disclosure; Page 35-36; 44pp; Japanese.

This invention relates to a method for the preparation of a physiologically active peptide having a cleaved cysteine residue at the end N-terminal, and has any of the amino acid sequences given in AAB651316. The invention includes sequences AAB65137 - AAB65137 which represent proteins related to the main proteins of the invention, including agalanin receptors, and basic fibroblast growth factor. DNA sequences AAR44055 - AAR44071 and PCR primers AAR44072 - AAR44086 are used in the isolation and characterisation of DNA encoding the proteins of the invention.

e.g. improve Peptides binding to galanin receptor proteins, used to, kidney functioning

Example 19; Page 90-91; 153pp; Japanese.

The present invention describes peptides (I) binding to galanin receptor proteins. (I) contain the sequence APAHRGRGG or one substantially identical to it, and their precursors, salts, amides and esters, which bind especially to rat galanin receptor proteins. Products from the present invention are used in assays of galanin/galanin receptor binding and the development of Grugs acting on galanin/galanin receptor binding function improvers, appetite improvers, and function regulators for the womb, kidney, prostate, testis or skeletal muscle. AAY45129 to AAX45154 and AAZ25518 to AAX2552 represent sequences used in the exemplification of the present invention.

This invention relates to a method for the preparation of a physiologically active peptide having a cleaved cysteine residue at the end N-terminal, and has any of the amino acid sequences given in AAB65131 - AAB65135. The invention includes sequences AAB65137 - AAB65153 which represent proteins related to the main proteins of the invention, including galanin receptors, and basic fibroblast growth factor. DNA sequences AAR44065 - AAR44071 and PCR primers AAR44072 - AAR44086 are used in the isolation and characterisation of DNA encoding the proteins

The invention includes sequences AAB65137 - AAB65153 which represent proteins related to the main proteins of the invention, including galanin receptors, and basic fibroblast growth factor. DNA sequences AAF44065 - AAF44071 and PCR primers AAF44072 - AAF44086 are used in the isolation and characterisation of DNA encoding the proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       133 occgiociocaccitococaaaigggigaccaagacggaaagagggagacagcciigag 192

NOTICE: This sequence may not be the entire insert of this clone. It may be shorter because we only sequence overlapping sections once, or longer because we provide a small overlap between neighboring submissions.

Washington University,

Department of Genetics, Washii St. Louis, MO 63108, USA e-mail: rw@nematode.wustl.edu

Genome Sequencing Center

all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by This sequence was finished as follows unless otherwise noted: sequence from more than one subclone

Library information: Gridded Fugu library from the UK HGMP Resource Centre at Hinxton.

NEIGHBORING COSMID INFORMATION:

The left neighbor is 259C6, 19100 base overlap. The actual start of this clone is at base position 22192 of 259C6; the actual end is at base position 28199 of 48D10.

This cosmid contains a tandem repeat from 23145 to 25326. The tandem is deleted, and has regions which are single stranded. Attempts to size the deletion with digest data were inconclusive. The size was estimated to be 1.7 kb from a PCR product obtained by Dr. Dick Sandford.

Coding sequences below are predicted from computer analysis, using the program Genefinder(P. Green and L. Hillier, ms in preparation).

```
/note="Vector: Diasmid pBk-CMV; Site_1: ECORI; Site_2:
XhoI; mRNA was made from roots of spring barley variety
'Barke', a high quality malting variety. Roots were grown
for two days on filter paper at room temperature Cloning
Sites: ECORI (5'-end of CDNA) and XhoI (3'-end of CDNA).
NOTE: Due to a cloning artefact caused by the kit, in most
cases the ECORI site is NOT present, as well as the ECORI
adapter. Average insert size is 1 kb Sequence trimming:
Vector sequences and sequence ends were trimmed from the
5'-and 3'-end until a 50 bp window contains less than two
ambiguities. The maximum length was set to 700 bp"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Hordeum vulgare

/note="Nector: plasmid pBR-CMV; Site_1: EcoRI; Site_2:
Xho1; mRNA was made from roots of spring barley variety
'Barke', a high quality malting variety. Roots were grown
for two days on filter paper at room temperature Cloning
sites: EcoRI (5'-end of CDNA) and XhoI (3'-end of CDNA)
NOTE: Due to a cloning artefact caused by the kit, in most
cases the EcoRI site is NOT present, as well as the EcoRI
adapter. Average insert size is 1 kb Sequence trimming:
Vector sequences and sequence ends were trimmed from the
5'-and 3'-end until a 50 bp window contains less than two
ambiguities: The maximum length was set to 700 bp"

The UI-R-A1 library consisted of a mixture of individually tagged normalized libraries constructed from at placente, adult lung, brain, library consisted of a mixture of individually tagged normalized libraries constructed from B, 12 and 18-day embryo. The tag is a string of 3-5 nucleotides present between the Not I site and the oligo-dr track which allows identification of the library of origin of a clone constructed as follows: PCR amplified cDNA inserts from a been derived was used as a fullors in a hybridization with the pooled UI-R-A1 and UI-R-E1 library in a hybridization with single-stranded circles. The remaining single-stranded circles (subtracted library in the form of single-stranded circles. The remaining single-stranded circles.
